For example, if you know that the quadratic parent function $(y = \{ \{x\} ^ \{2\} \})$ is being transformed 2 units to the right, and 1 unit down (only a shift, not a stretch or a flip yet), we can create the original t-chart, following by the transformation points on the outside of the original points. Then we can plot the “outside” (new) points to ...

In Algebra 1, students reasoned about graphs of absolute value and quadratic functions by thinking of them as transformations of the parent functions $|x|$ and x^2 . In this unit, we extend this idea to include transformations of any function whatsoever. This fascinating concept allows us to graph many other types of functions, like square/cube root,
