Histological techniques are the techniques which have been developed for the processing of the specimens, mainly tissues, for the proper diagnosis of the diseases associated. The small pieces of the tissues or sometimes whole organs are submitted to the histopathology laboratory for the diagnosis of any abnormalities if present.

In brief, histological processing involves obtaining fresh tissue, preserving it (i.e., fixing it) in order to allow it to remain in as life-like a state as possible, cutting it into very thin sections (3-8 microns), mounting it on glass microscopic slides, and then staining the sections so that they can be observed under a microscope to identify different histological components within the tissue.

INTRODUCTION TO HISTOPATHOLOGY & CYTOPATHOLOGY. Cells are the simplest unit of living matter that can maintain life and reproduce within themselves. Groups of these cells unite to perform a specific function, called tissues. The tissues of the body consist of a large number of cells and they are classified according to the shape size and functions of the cells.
