The amp design is the critical factor to a greater degree than transistor type. I have used both, have both now. One advantage of mosfets is that they can handle more power per pair. The GamuT amps only use one pair for 200 watts, some can handle 500 watts a pair. They are generally more rugged also.

A MOSFET amplifier is a subcategory of amplifiers that employs metal-oxide-semiconductor field-effect transistor (MOSFET) technology to process digital signals with relatively low power consumption. Once limited to only high-end products, by the early 21st century, MOSFET circuits are the design of choice in more than 99% of microchips ...

I have built some small amps using 2 MRF512's, for 40W out Class C (I only operate FSK and CW), using a surplus 24 V switching supply. At less than \$1 each, they are a nice solution for a stand-alone rig or as a driver for a GG amp. For high power, you can't beat the price of an old SB220 amp, or similar.
